in 1961 Smale established the generalized Poincaré conjecture in dimensions greater than or equal to 5 [129] and proceeded to prove the h-cobordism theorem [130]. This result inaugurated a major effort to classify all possible smooth and topological structures on manifolds of

dimension at least 5 by the mid 1970 s the main outlines of this theory were complete and explicit answers especially concerning simply connected manifolds as well as general qualitative results had been obtained as an example of such a qualitative result a closed simply connected manifold of dimension $2 \leq n \leq 5$ is determined up to finitely many diffeomorphism possibilities by its homotopy type and its pontrjagin classes there are similar results for self diffeomorphisms which at least in the simply connected case say that the group of self diffeomorphisms of a closed manifold M of dimension at least 5 is commensurate with an arithmetic subgroup of the linear algebraic group of all automorphisms of its so called rational minimal model which preserve the pontrjagin classes 131 once the high dimensional theory was in good shape attention shifted to the remaining and seemingly exceptional dimensions 3 and 4 the theory behind the results for manifolds of dimension at least 5 does not carryover to manifolds of these low dimensions essentially because there is no longer enough room to maneuver thus new ideas are necessary to study manifolds of these low dimensions

what a wonderful book i strongly recommend this book to anyone especially graduate students interested in getting a sense of 4 manifolds maa reviews the book gives an excellent overview of 4 manifolds with many figures and historical notes graduate students nonexperts and experts alike will enjoy browsing through it robion c kirby university of california berkeley this book offers a panorama of the topology of simply connected smooth manifolds of dimension four dimension four is unlike any other dimension it is large enough to have room for wild things to happen but small enough so that there is no room to undo the wildness for example only manifolds of dimension four can exhibit infinitely many distinct smooth structures indeed their topology remains the least understood today to put things in context the book starts with a survey of higher dimensions and of topological 4 manifolds in the second part the main invariant of a 4 manifold the intersection form and its interaction with the topology of the manifold are investigated in the third part as an important source of examples complex surfaces are reviewed in the final fourth part of the book gauge theory is presented this differential geometric method has brought to light how unwieldy smooth 4 manifolds truly are and while bringing new insights has raised more questions than answers the structure of the book is modular organized into a main track of about two hundred pages augmented by extensive notes at the end of each chapter where many extra details proofs and developments are presented to help the reader the text is peppered with over 250 illustrations and has an extensive index

learning to fly is an exciting adventure and challenge learning aviation theory is part of that to help you on that journey we wanted to create the most modern concise and beautifully presented aviation theory guides out there there are many aspects of aviation theory that are tested in the six subjects of the new zealand ppl syllabus each subject and its component topics could be studied in exhaustive detail much of which is excessive to the private pilot and detracts from the key points we focussed this book on those key points and is presented in a question and answer conversational style that helps you understand and remember the information this single book covers the entire caa nz syllabus for the private pilot the book is divided into six parts covering each subject the book is fully indexed and contains over 200 figures

this comprehensive textbook on relativity integrates newtonian physics special relativity and general relativity into a single book that emphasizes the deep underlying principles common to them all yet explains how they are applied in different ways in these three contexts newton s ideas about how to represent space and time his laws of dynamics and his theory of gravitation established the conceptual foundation from which modern physics developed book i in this volume offers undergraduates a modern view of newtonian theory emphasizing those aspects needed for understanding quantum and relativistic contemporary physics in 1905 albert einstein proposed a novel representation of space and time special relativity book ii presents relativistic dynamics in inertial and accelerated frames as well as a detailed overview of maxwell s theory of electromagnetism this provides undergraduate and graduate students with the background necessary for studying particle and accelerator physics astrophysics and einstein s theory of general relativity in 1915 einstein proposed a new theory of gravitation general relativity book iii in this volume develops the geometrical framework in which einstein s equations are formulated and presents several key applications black holes gravitational radiation and cosmology which will prepare graduate students to carry out research in relativistic astrophysics gravitational wave astronomy and cosmology
